RESEARCH/PROJECTS

Graph Generation with Flow Matching

2024 - Present

- Developing efficient graph generative model by generating its Eigen properties via flow matching

Bayesian model selection in VAE

2022 - 2023

- Developing a Bayesian model selection framework to infer an optimal model structure in variational autoencoders, guided by the data
- The framework eliminates the need to fine-tune network complexity for the encoding and decoding networks
- The framework is compatible with the state-of-the-art VAE regularization methods as well as various VAE variants, further improving their performance

Representation learning on graphs

2022 - 2024

- Applying Bayesian model selection to enhance graph representations by inferring appropriate neighborhood scope for message aggregation in a graph convolutional network (GCN).
- Using graph characteristics to infer the most plausible set of neighbors for message aggregation in a GCN.
- Analysis on the expressivity of graph convolutional network shows that our approach improves the expressivity of a GCN with larger layer depth.

Leveraging deep learning in graphs for biomedical interaction prediction

2021 - Present

- Application of developed graph algorithms to real-world biomedical scenarios, like inferring the interactions in the datasets like PPI(Protein-Protein Interaction), DTI(Drug-Target Interaction), etc.

Nepali Speech Recognition

2018 - 2019

- Application of deep learning to enhance the Nepali speech recognition system, transitioning from a limited vocabulary size to a large corpus. Connectionist Temporal Classification (CTC) loss aided in enabling end-to-end training of the recurrent neural network model.
- Defined a Nepali language character set of 67 characters.
